### Background

- Arsenic is a known neurotoxin which affects children, an especially vulnerable population.<sup>1</sup>
- Regular monitoring may not be feasible in historically disadvantaged areas, often due to budget constraints.<sup>2</sup>
- Approximately one third of NC residents rely on well water and are responsible for the monitoring of their own wells.<sup>3</sup>
- More innovative, novel, and cost-saving approaches may be needed to monitor water safety in the areas, such as using low-cost field kits.
- Preliminary data shows that these field kits may be difficult for civilian use (Fig. 1.)
- The SenSafe Quick<sup>™</sup> Arsenic II Test Kit was found to be a cost effective and reliable arsenic contaminant field kit.
- · However, ease of use showed to be a limit in usability.
- Reagent 2, potassium peroxymonosulfate accounts for a hydrogen sulfide interference in the production of arsine gas, the analyte of the test method.
- Uncommonly found in drinking water, accounted for by smell.
- How might the SenSafe Quick<sup>™</sup> Arsenic II Test Kit test procedure be simplified without compromising accuracy?

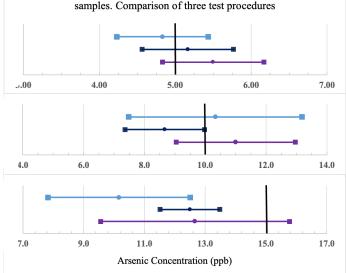

**Fig. 1**. Survey data collected regarding the ease of use of the vanilla Procedure. Users were generally unconfident in the test method.

JC GILLINGS SCHOOL OF GLOBAL PUBLIC HEALTH

#### Methods

- The SenSafe Quick<sup>™</sup> Arsenic II Test Kit was used in all trials.
- · Three test methods were investigated:
  - Vanilla (V): Original test procedure
  - Without reagent 2 (-2): Removed potassium peroxymonsulfate from the procedure.
- Without reagent 2, combined steps 1 and 3 (-2, 1+3): Removed reagent 2, added reagents 1 and 3 in the same step.
- Each method was tested at 5, 10, and 15 ppb, in triplicate.
- Three group ANOVA was conducted to examine differences.  $\alpha = 0.05$

95% Confidence intervals for 5, 10, and 15 ppb Arsenic

Vanilla Procedure Without Reagent 2 Without Reagent 2, Combined 1 and 3

Fig. 2. 95% confidence intervals of 5, 10, and 15 ppb Arsenic (top to bottom). All intervals within each concentration overlap.

## Results

- The p-values from each concentration are greater than the alpha of 0.05.
- We fail to reject the null hypothesis that there is a not difference in arsenic response between the test methods.

# Table 1. Three-way ANOVA: Arsenic response of three different test methods at 5, 10, and 15 ppb As<sup>3+</sup>

Test Method and Conc.		Sample mean (ppb)		Std. Dev	F	F-Crit	p-value
5 ppb	V	4.8	6	0.75	1.09	3.68	0.36
	-2	5.2	6	0.75			
	-2, 1+3	5.5	6	0.84			
10 ppb	V	10.3	3	2.5	1.22	5.13	0.36
	-2	8.7	3	1.2			
	-2, 1+3	11.0	3	1.7			
15 ppb	V	10.2	6	2.9	1.40	3.68	0.28
	-2	12.5	6	1.2			
	-2, 1+3	12.7	6	3.9			

# Conclusion

- Significant simplifying modifications to the SenSafe Quick™ Arsenic II Test Kit were found to have no significant difference in test results among the three modifications.
- Removing reagent 2, as well as combining reagents 1 and 3 may be a viable method of increasing accessibility and usability of the SenSafe Quick™ Arsenic II Test Kit by untrained civilians while maintaining acceptable accuracy.
